

A 3,000 year-old Egyptian emmer wheat genome reveals dispersal and domestication history

Michael F Scott

Human societies need food – and that often means wheat

- Most widely grown crop, accounting for 1/5 calories today

First whole genome sequence data from an ancient wheat

- A museum specimen of **Emmer wheat** from Egypt

Dispersal

- Which modern emmer wheats are **most closely related** to this ancient emmer wheat?

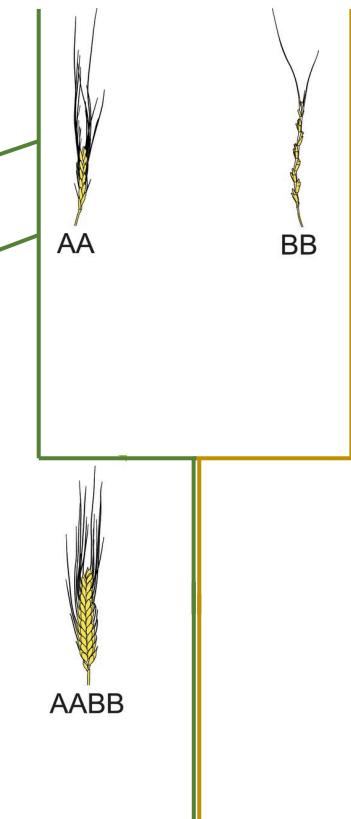

Domestication

- Does this ancient emmer wheat **share a selection history** with modern domesticated emmers?

Wild Wheats

Wild Einkorn
T. monococcum

T. urartu

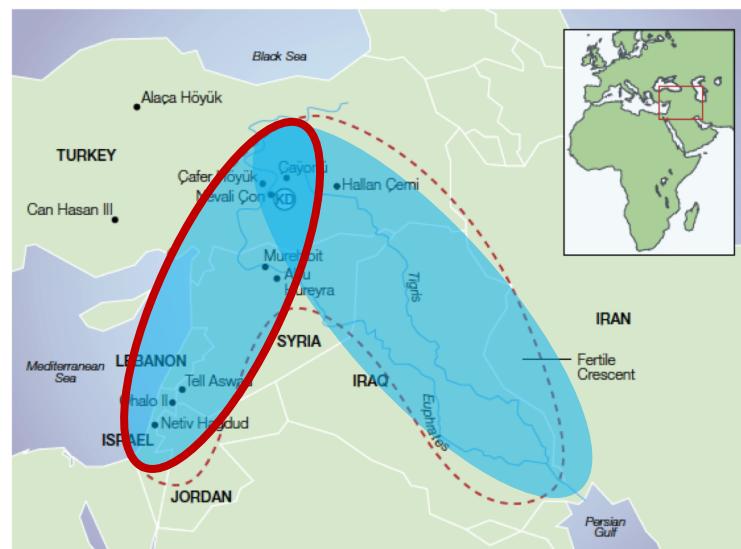

Wild Einkorn and Emmer
were cultivated in the
Levant from around
9,700BCE

Wild Emmer
T. dicoccoides

A. speltoides

Levant

Fertile Crescent

Domesticated Wheats

Domesticated Einkorn

T. monococcum

Wild Einkorn

T. monococcum

T. urartu

AA

BB

A. speloides

Phenotypically, cultivated Einkorn and Emmer look domesticated from around **6,300BCE**

Wild Emmer
T. dicoccoides

Domesticated Emmer
T. dicoccum

Free-threshing Wheats

Domesticated
Einkorn

T. monococcum

Wild Einkorn

T. monococcum

T. urartu

AA

BB

A. speltoides

DD

A. tauschii

AABB

Emmer is the progenitor of the economically important modern **free-threshing Durum** wheat and **Bread** wheat: found from around **7000BCE**

Wild Emmer
T. dicoccoides

Domesticated Emmer
T. dicoccum

Durum
T. durum

Bread
T. aestivum

AABBDD

Free-threshing versus hulled

Free-threshing wheats appear **around 7000BCE** but not preferred until between **5000BCE** and **1000CE** in different regions

Hulled

Free-Threshing

Free-threshing versus hulled

Free-threshing wheats appear **around 7000BCE** but not preferred until between **5000BCE** and **1000CE** in different regions

Hulled wheats may have been preferred for:

- Hardiness
- Protection of seeds from pest during storage
- Cultural preference/taste

Hulled

Free-Threshing

Accession Context

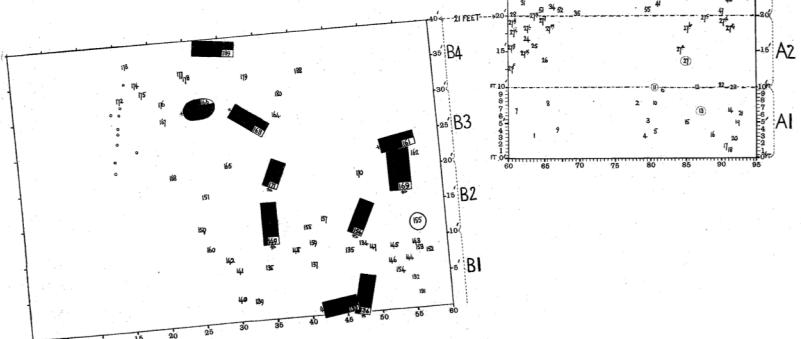

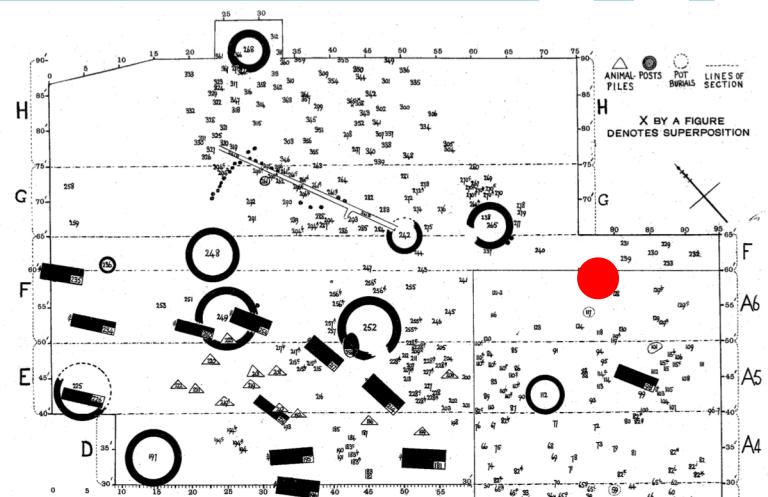

Hememiah North Spur excavation (1924)

- Predynastic huts, **4400-4000BCE** (circles)
- Intrusive Old Kingdom burials, **2686-2181BCE** (rectangles)

Emmer Chaff (red)

- Chaff from side of a hearth
- Replicated AMS ^{14}C dating on two specimens to New Kingdom **1130-1000Cal. BCE**

Brunton & Caton-Thompson (1928)

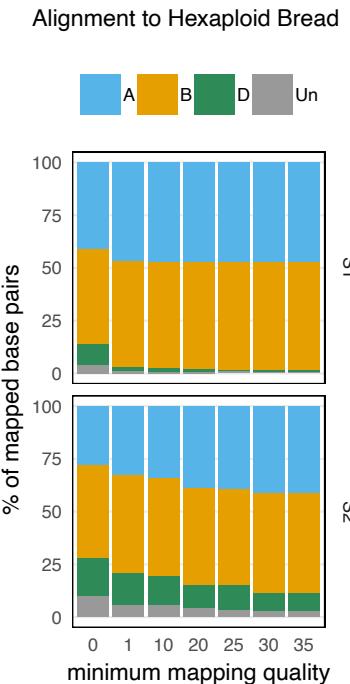

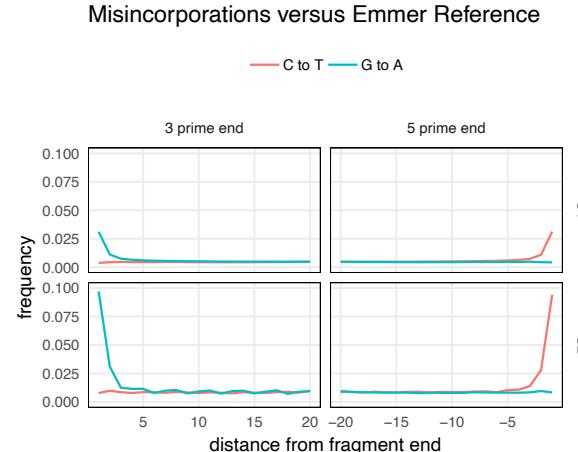

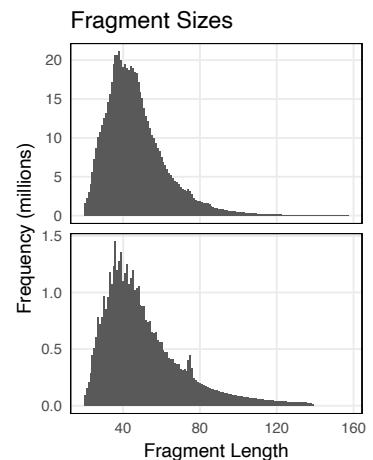

Accession

aDNA statistics

S2 not immersed in bleach

Endogenous content estimates: 66% (of 861m reads) and 33% (of 59.3m reads)

Genotype Calling

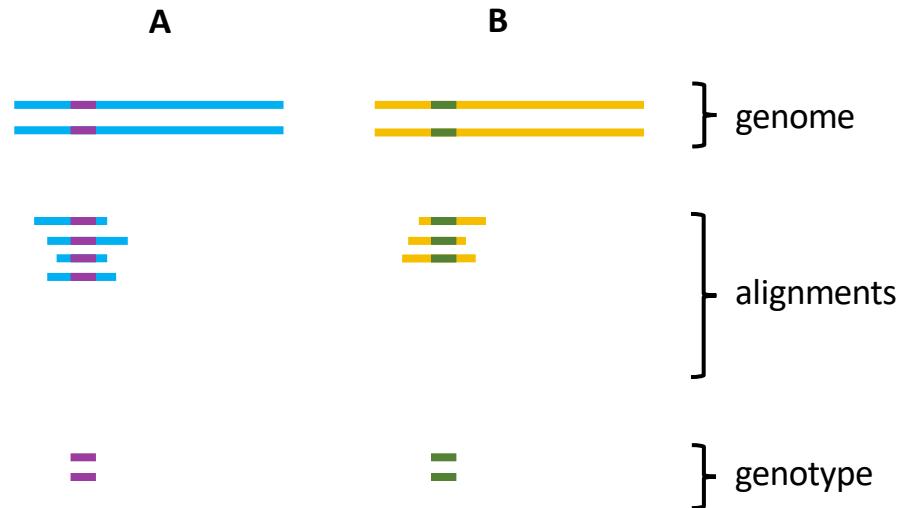

Genotypes called at **1.4m exonic SNP sites** identified
in modern emmer wheats

- Allopolyploid - no sites with multiple called heterozygotes

Genotype Calling

Genotypes called at **1.4m exonic SNP sites** identified
in modern emmer wheats

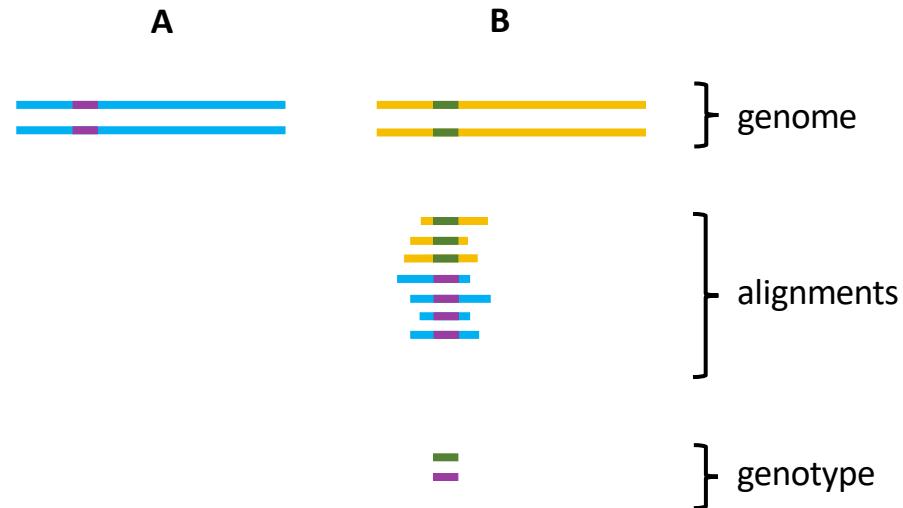

- Allopolyploid - no sites with multiple called heterozygotes

Genotype Calling

Genotypes called at **1.4m exonic SNP sites** identified
in modern emmer wheats

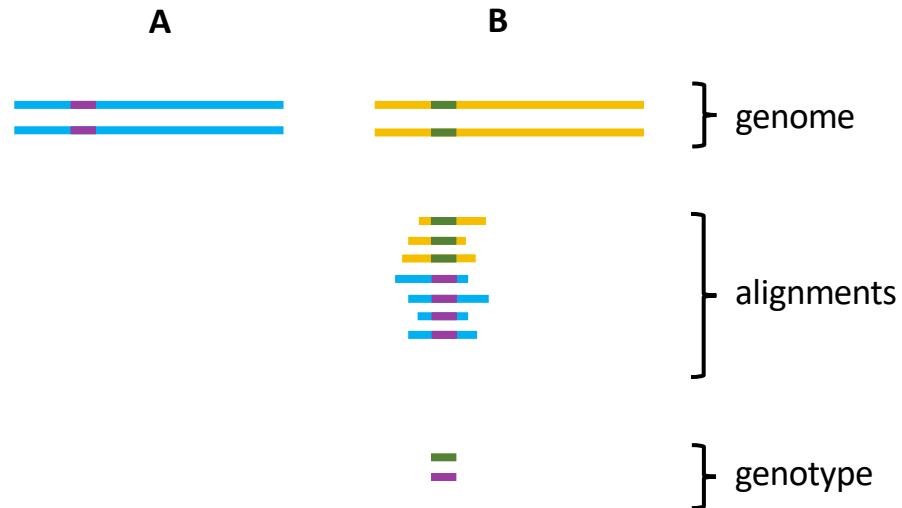

- Allopolyploid - no sites with multiple called heterozygotes

Genotype Calling

Genotypes called at **1.4m exonic SNP sites** identified in modern emmer wheats

- Allopolyploid - no sites with multiple called heterozygotes

- ~1.2% heterozygosity based on 3,160 sites with at least 4x coverage, c.f. 0.4%-4.1% in modern samples (mean, 1.4%; s.d., 0.6%).

0.48x coverage of 1.4m exonic SNP sites

- Reference bias correction (Günther & Nettelblad, 2019)
- 93.5% concordance with S2 calls,
80.7% average concordance with modern emmers,
87.4% max.
- **99,078** sites called with at least 2x coverage

Dispersal

- Which modern emmer wheats are **most closely related** to this ancient emmer wheat?

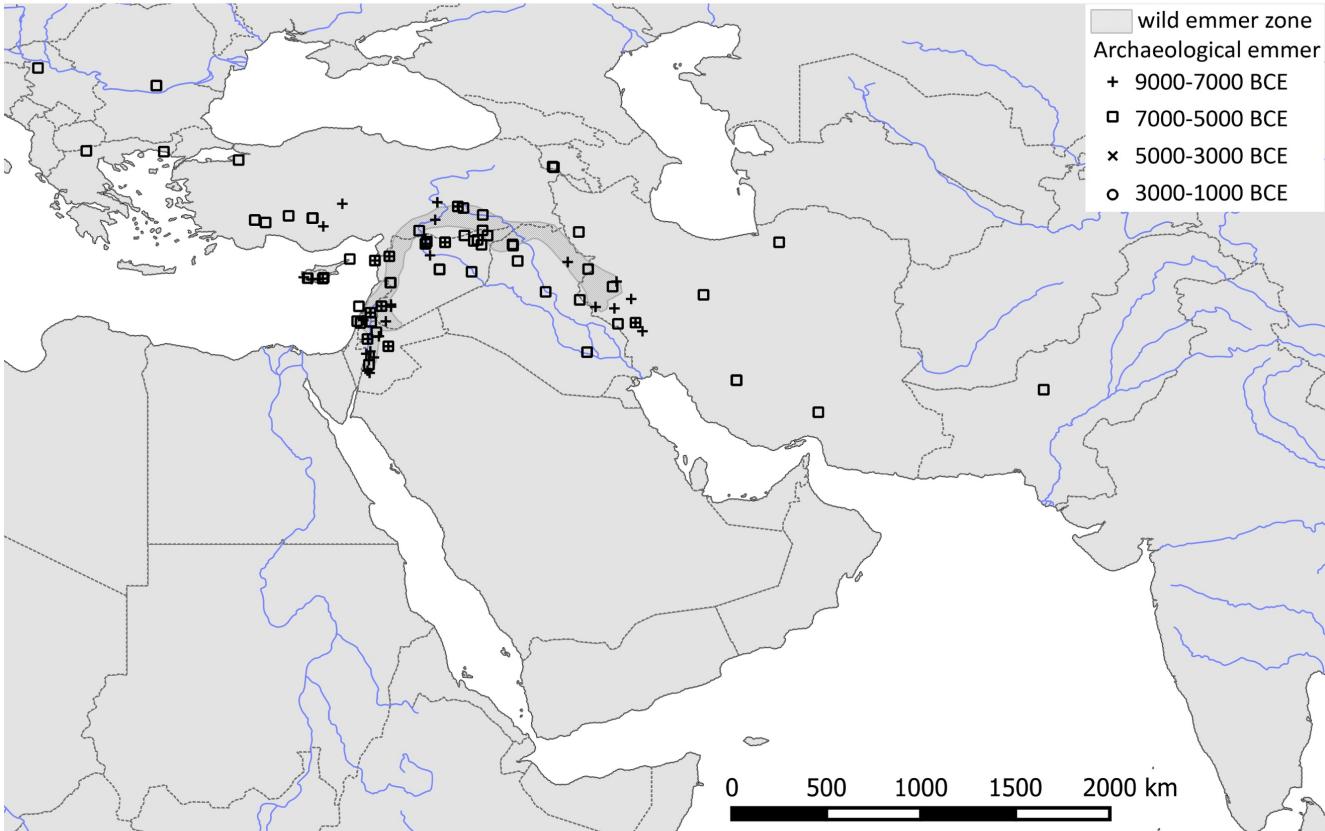

Domestication

- Does this ancient emmer wheat **share a selection history** with modern domesticated emmers?

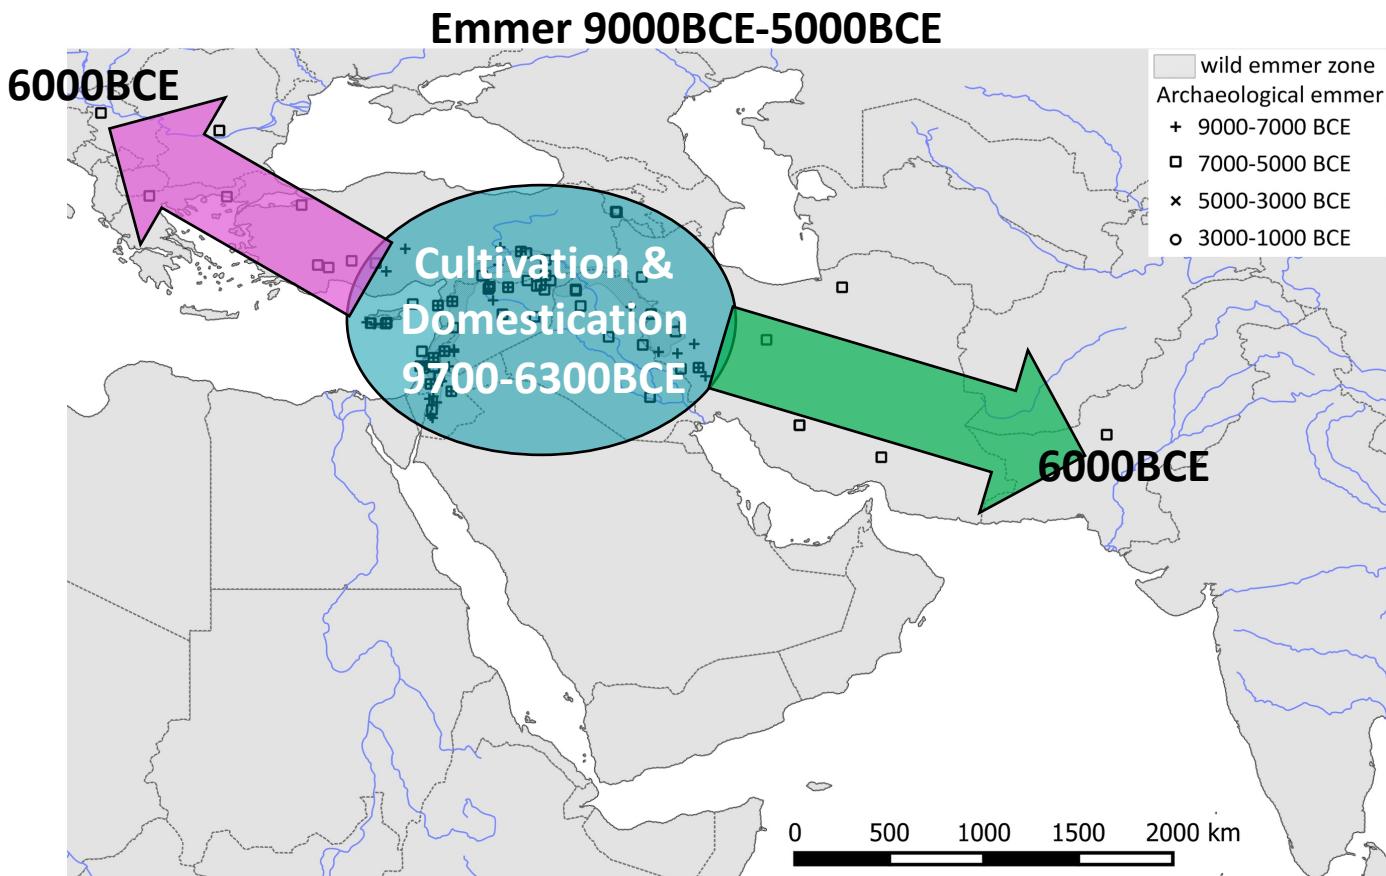

Emmer Dispersal (Archaeobotanical data)

Emmer 9000BCE-5000BCE

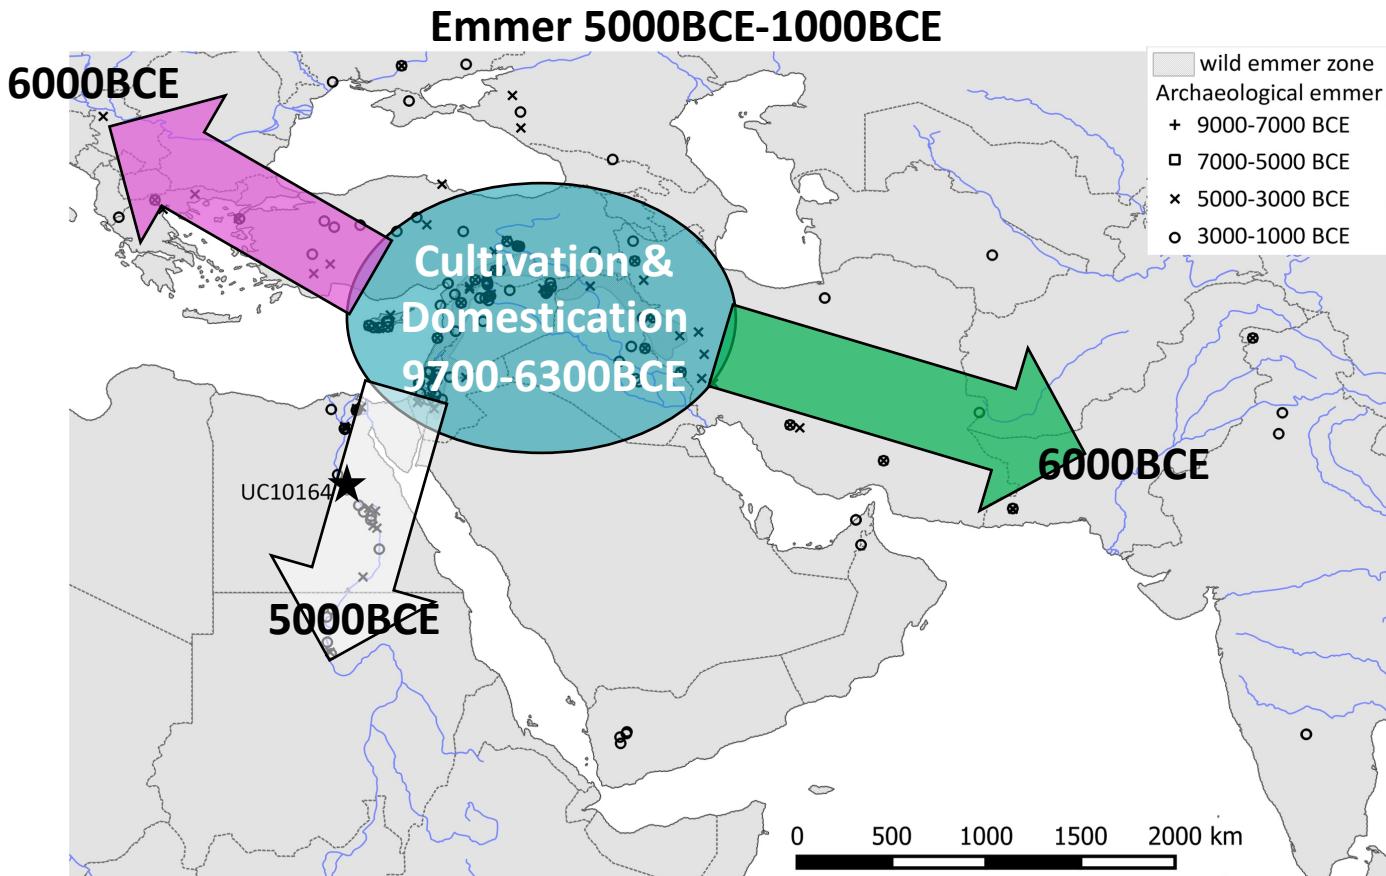

Emmer Dispersal (Archaeobotanical data)

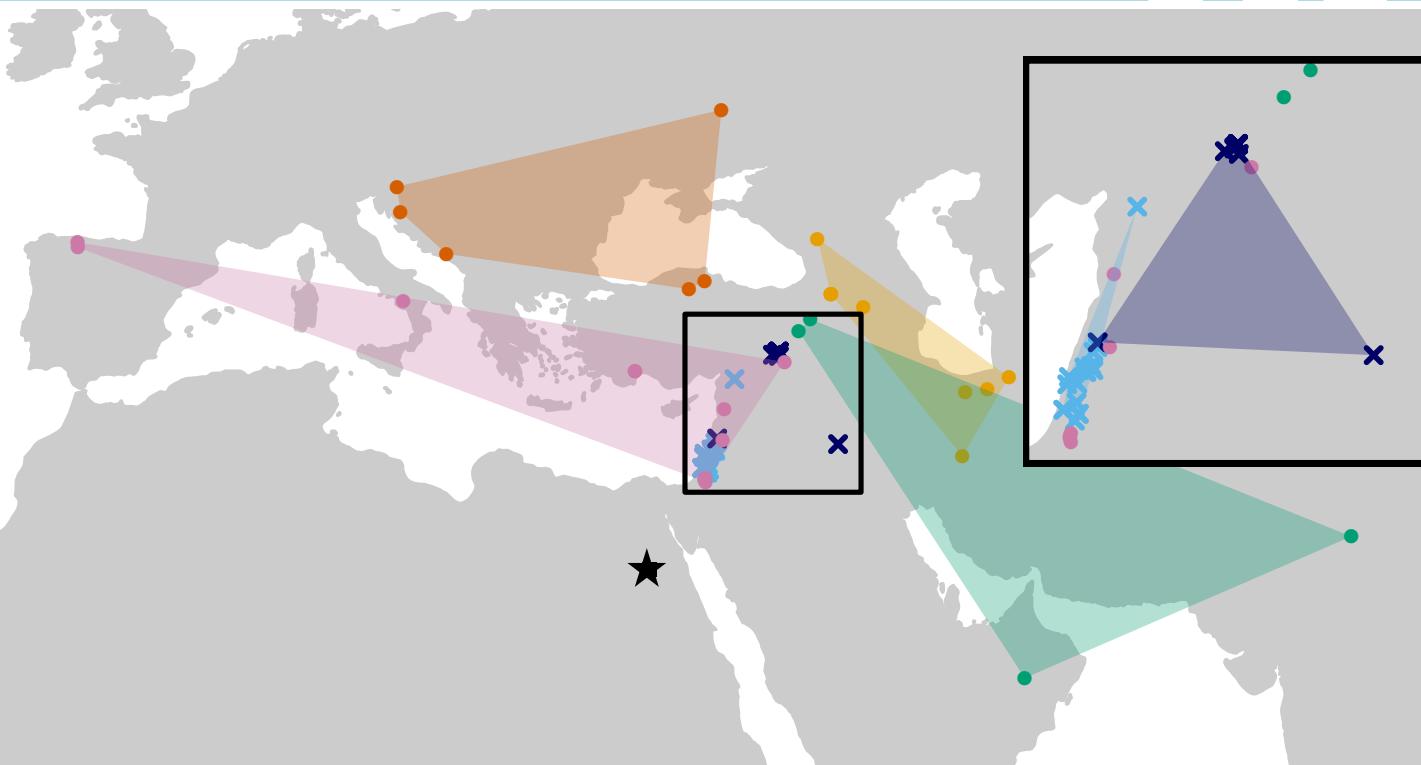

Emmer Dispersal (Archaeobotanical data)

which dispersal event is ancient Egyptian emmer connected with?

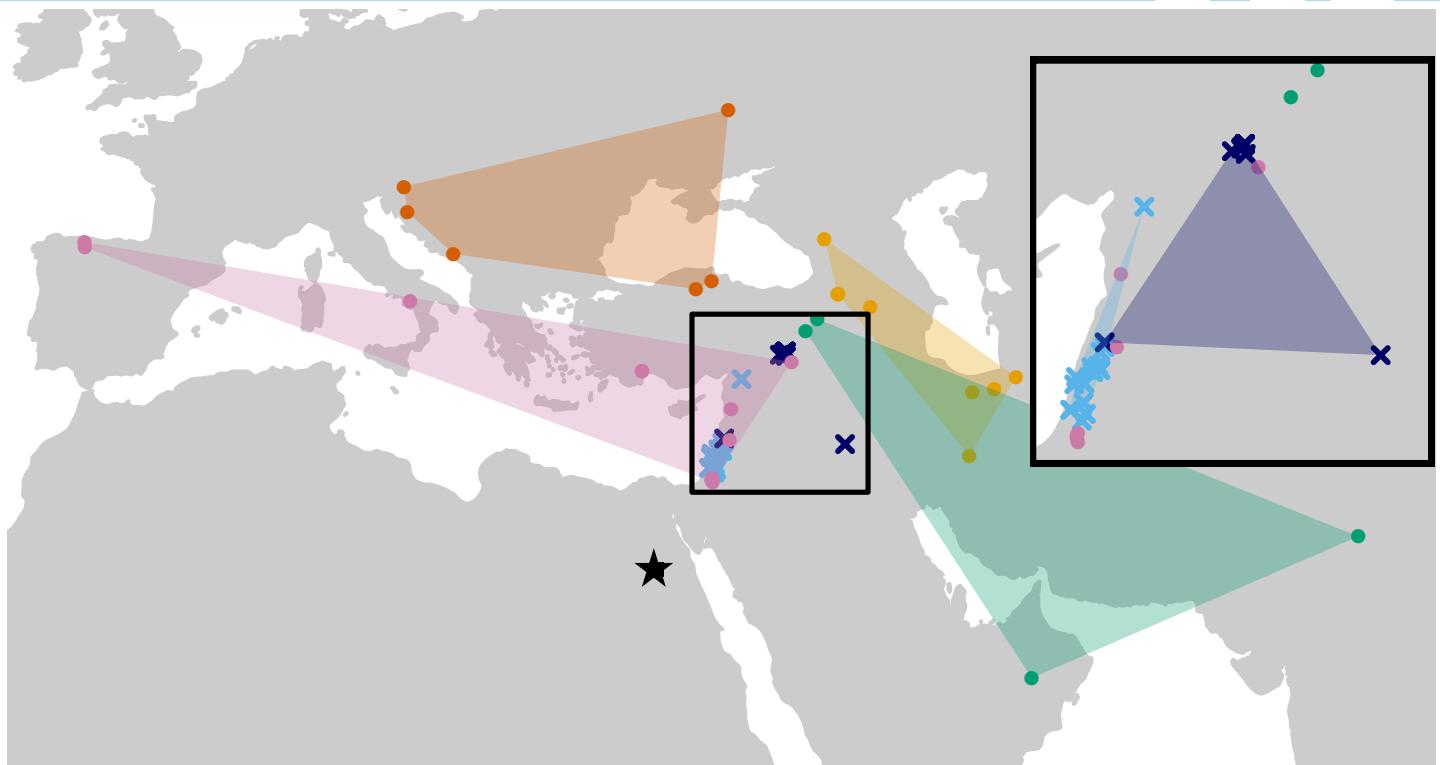

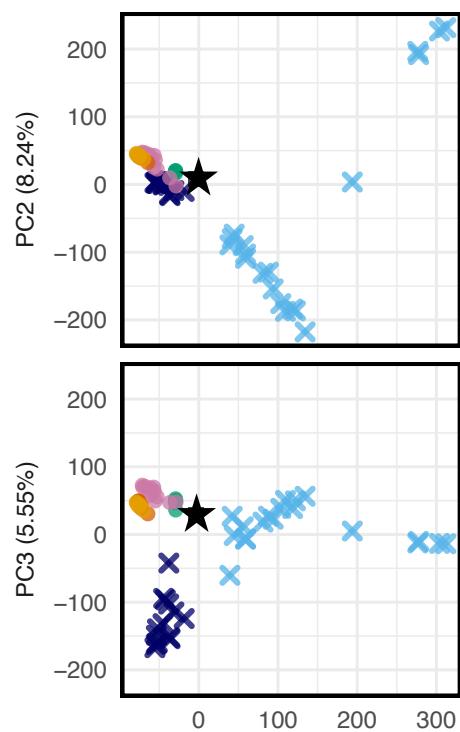

Emmer Dispersal (Genetic data)

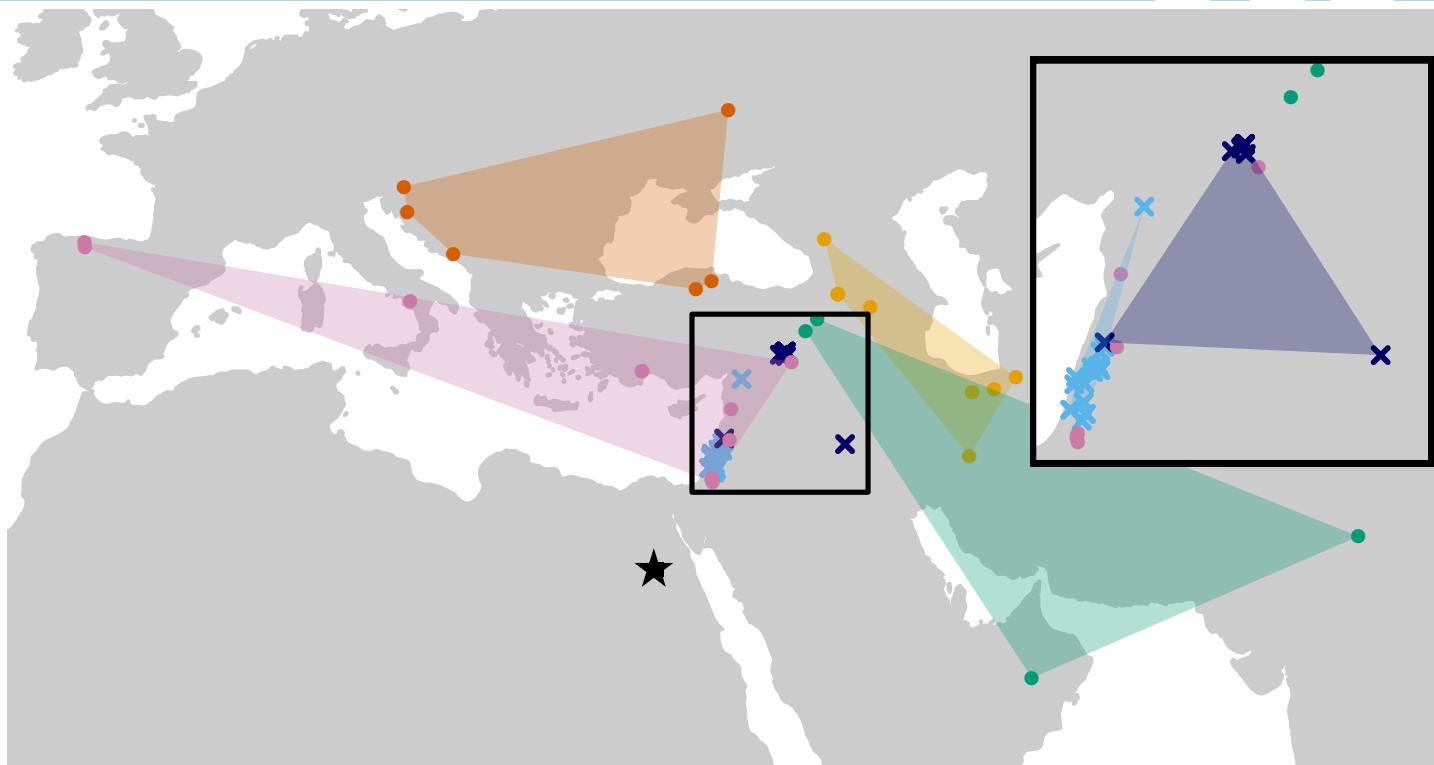

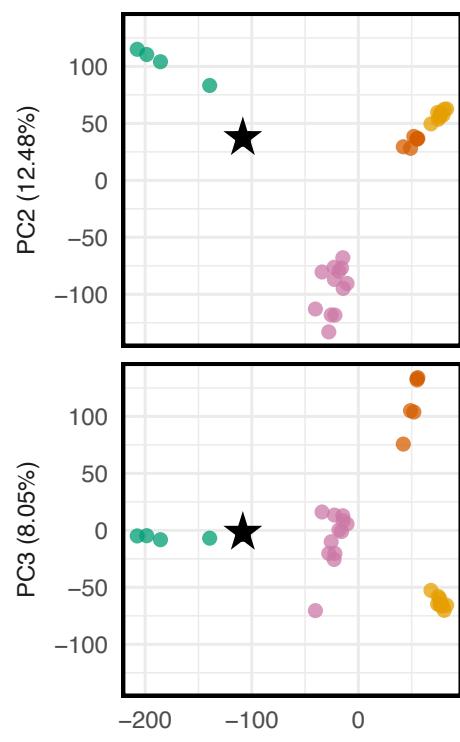

★ Ancient Egyptian ● Eastern Europe (Dom) ● Mediterranean (Dom) ✕ Southern Levant (Wild)
● Caucasus (Dom) ● Indian Ocean (Dom) ✕ Northern Levant (Wild)

Emmer Dispersal (Genetic data)

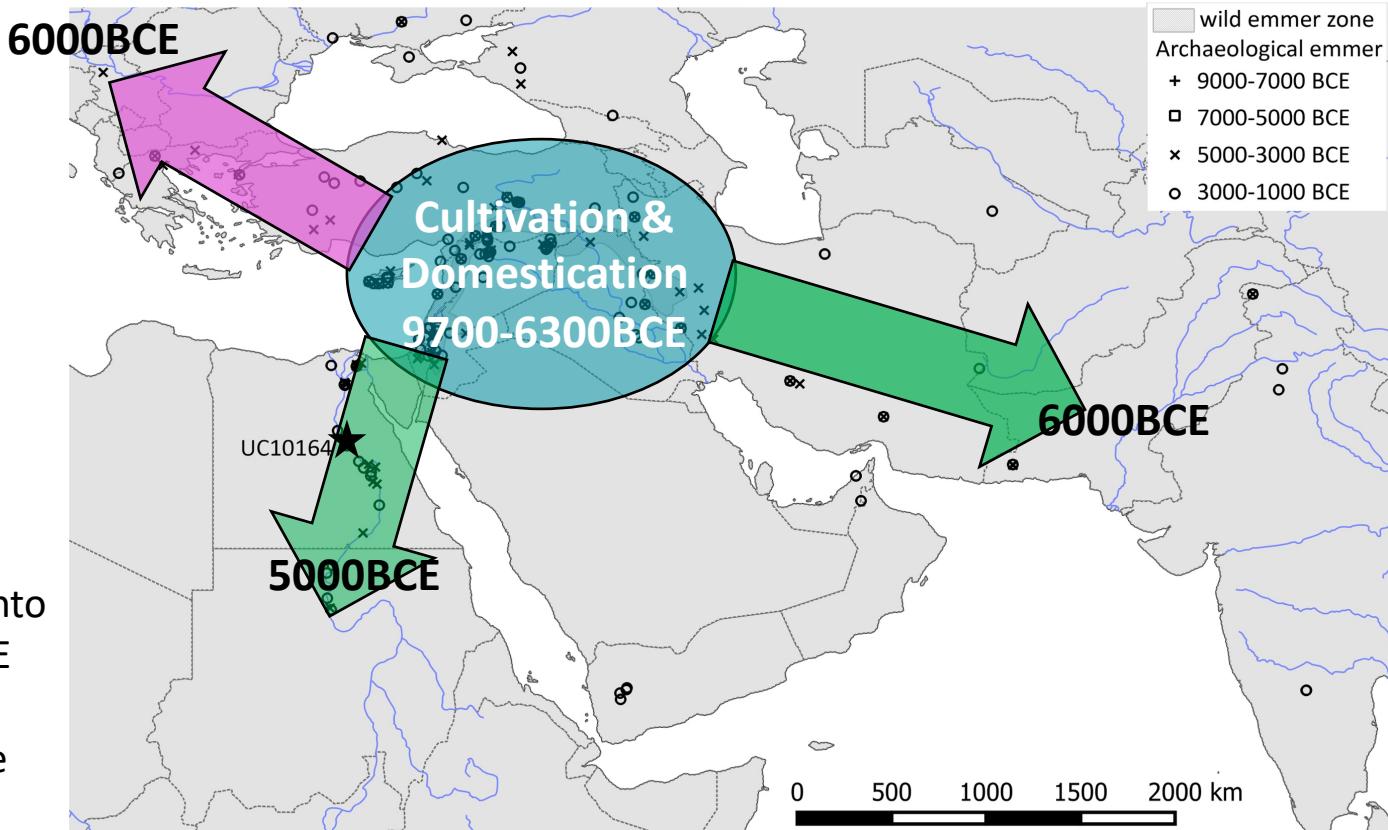

★ Ancient Egyptian ● Eastern Europe (Dom) ● Mediterranean (Dom) ✕ Southern Levant (Wild)
● Caucasus (Dom) ● Indian Ocean (Dom) ✕ Northern Levant (Wild)

Emmer Dispersal (Genetic data)

★ Ancient Egyptian ● Eastern Europe (Dom) ● Mediterranean (Dom) ✕ Southern Levant (Wild)
● Caucasus (Dom) ● Indian Ocean (Dom) ✕ Northern Levant (Wild)

Emmer Dispersal Conclusions

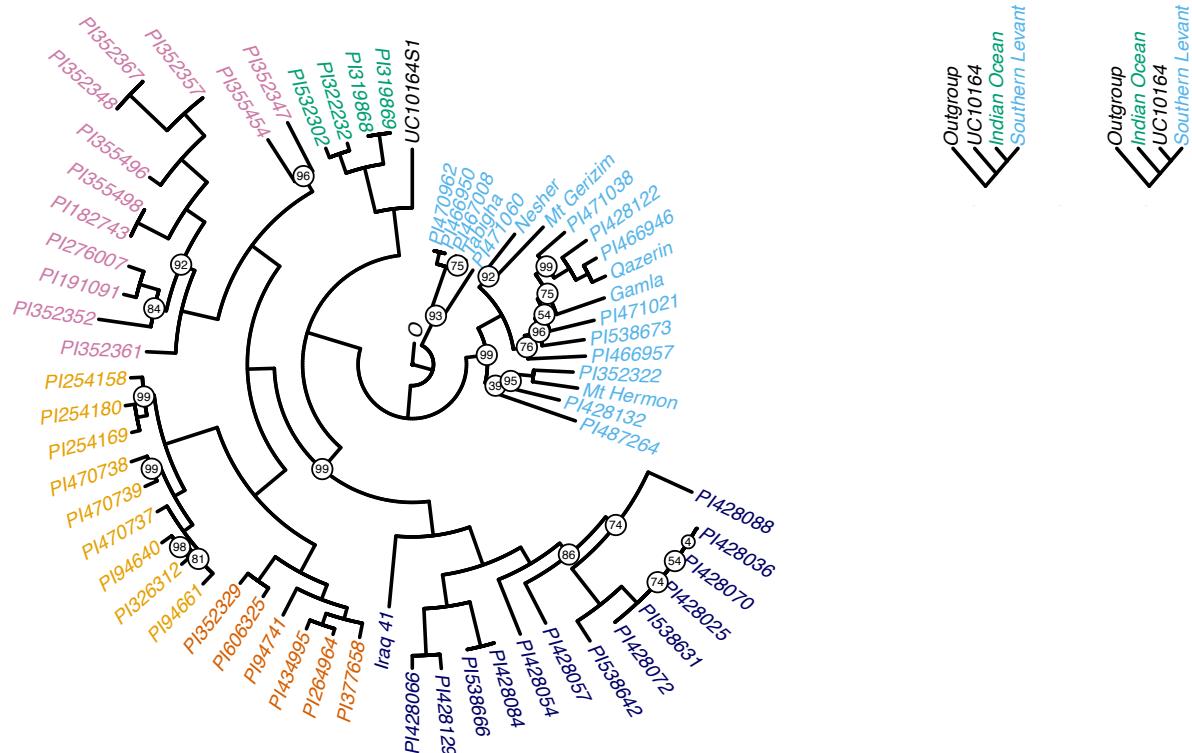

Wild-Domesticated Gene Flow

genetic exchange with wild populations?

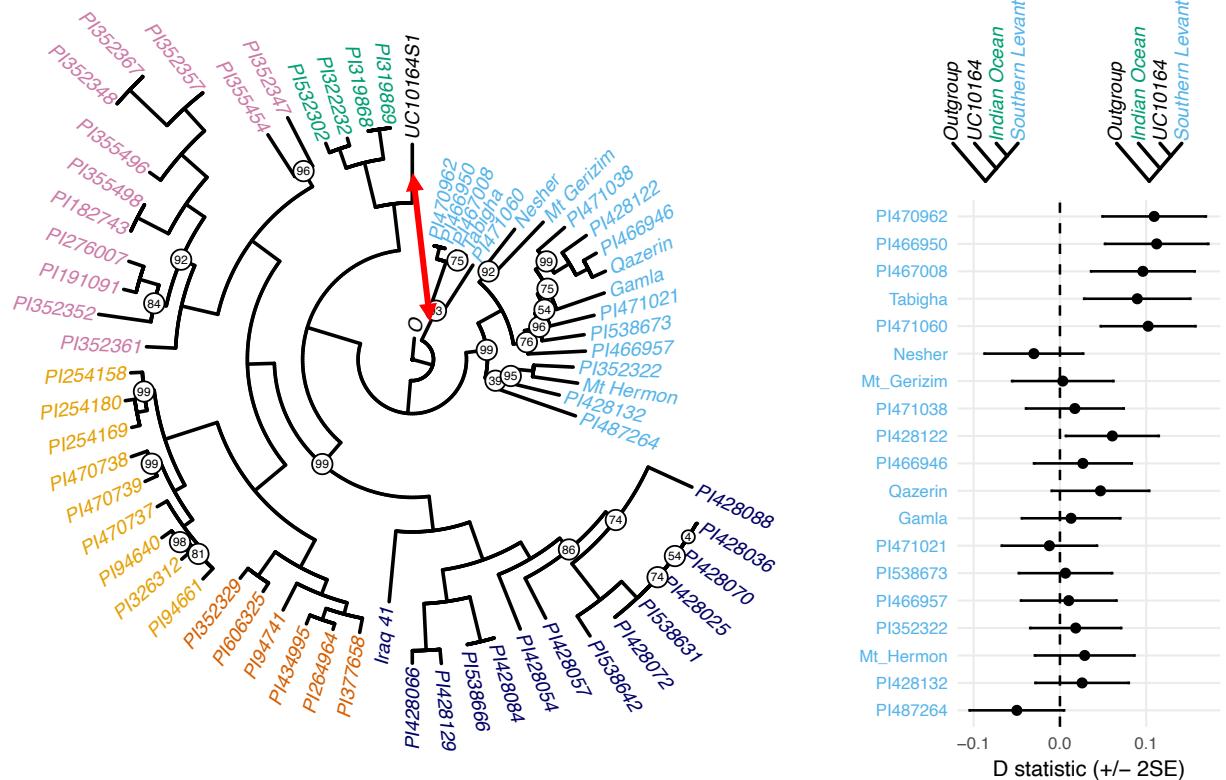

- ★ Ancient Egyptian
- Eastern Europe (Dom)
- Mediterranean (Dom)
- ✖ Southern Levant (Wild)
- Caucasus (Dom)
- Indian Ocean (Dom)
- ✖ Northern Levant (Wild)

Four Population test

★ Ancient Egyptian • Eastern Europe (Dom) ● Mediterranean (Dom) ✕ Southern Levant (Wild)
● Caucasus (Dom) ● Indian Ocean (Dom) ✕ Northern Levant (Wild)

Four Population test

★ Ancient Egyptian
 ● Eastern Europe (Dom)
 ● Mediterranean (Dom)
 ✖ Southern Levant (Wild)
● Caucasus (Dom)
 ● Indian Ocean (Dom)
 ✖ Northern Levant (Wild)

Gene Flow Conclusions

genetic exchange with wild Southern Levant emmers during dispersal or subsequent contact

Dispersal

- Which modern emmer wheats are **most closely related** to this ancient emmer wheat?

Domestication

- Does this ancient emmer wheat **share a selection history** with modern domesticated emmers?

Emmer Domestication Phenotypes

Definitional domestication trait is **non-shattering**

- domesticated emmer wheats retain their seeds and are therefore dependent upon humans for dispersal

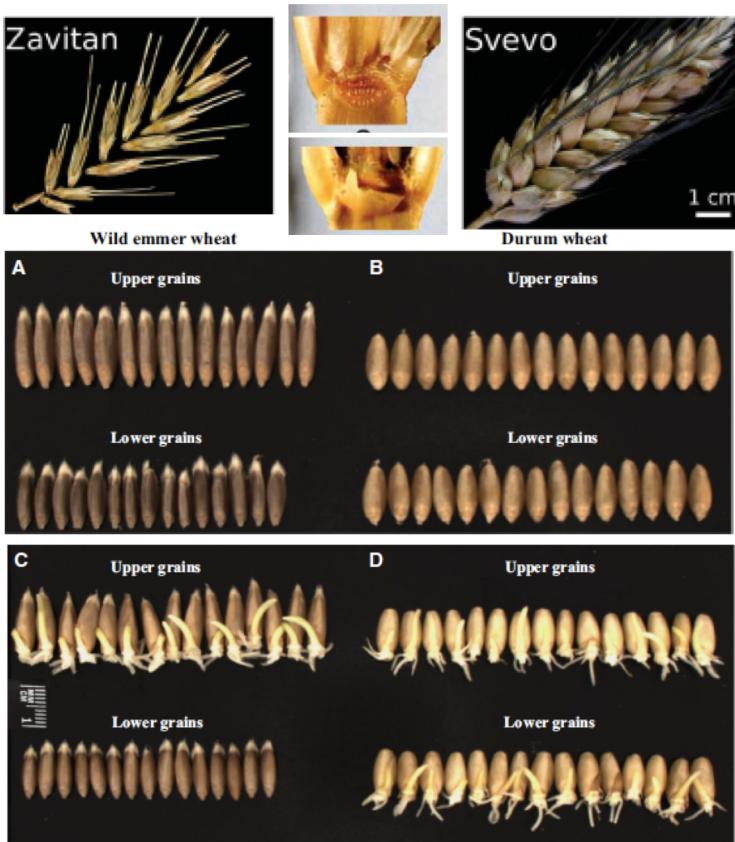

Emmer Domestication Phenotypes

Definitional domestication trait is **non-shattering**

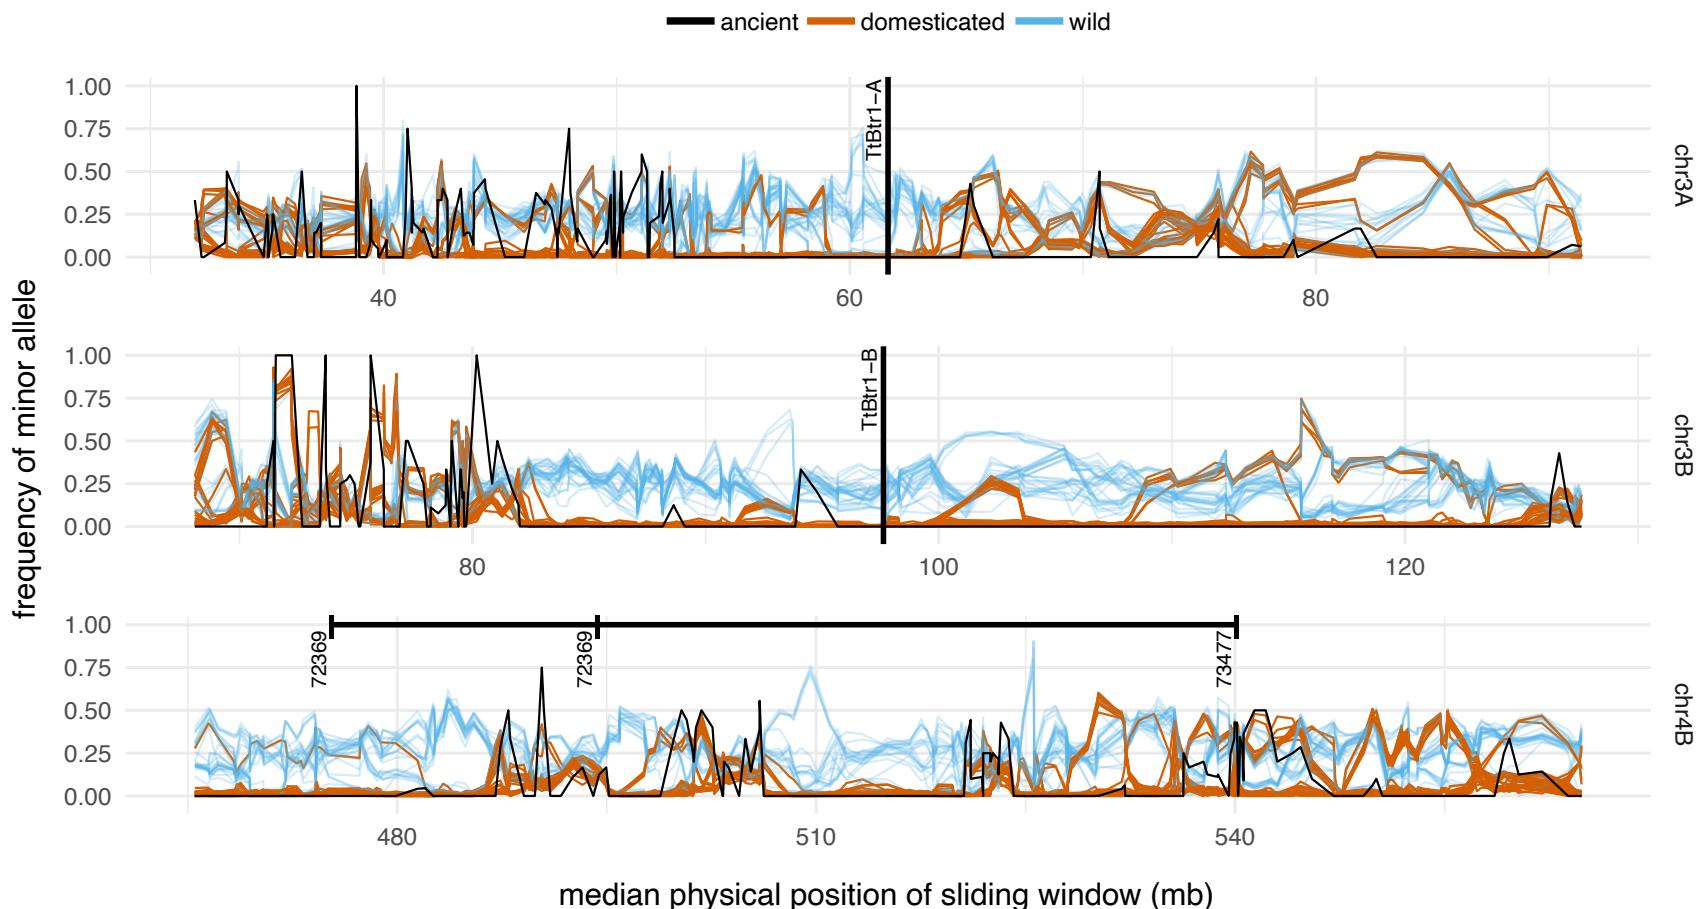

- domesticated emmer wheats retain their seeds and are therefore dependent upon humans for dispersal

In domesticated emmer wheats, both seeds in each spikelet are:

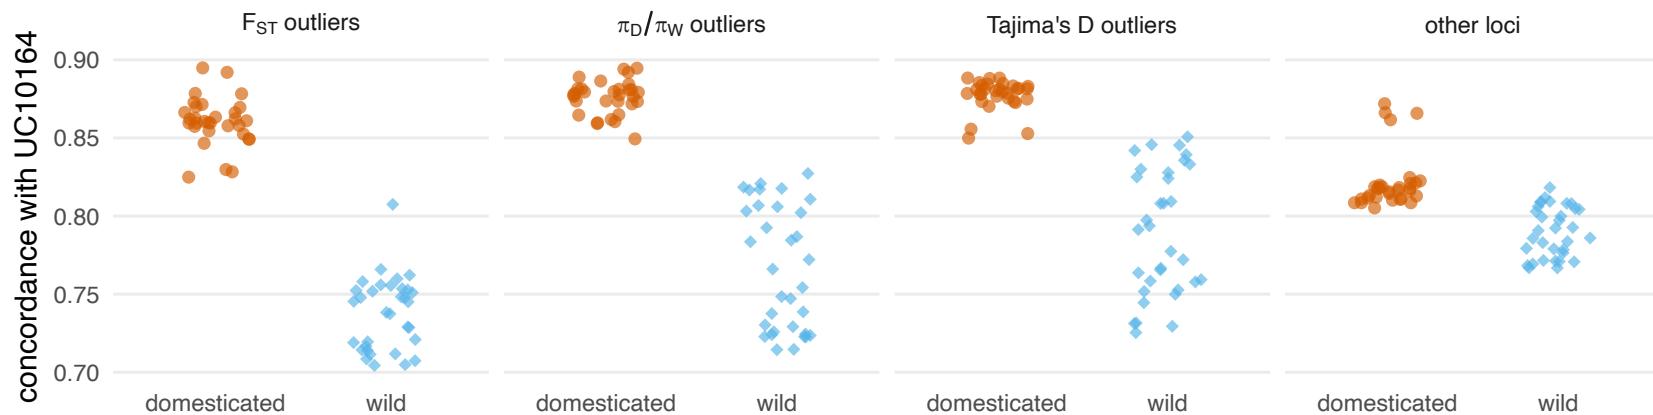

- large**
- germinate readily**

Emmer Domestication QTL

Emmer Domestication Selection Scans

Emmer Domestication Conclusions

Ancient Egyptian emmer shares a history of selection with modern domesticated emmers that includes and extends beyond well-characterized QTLs

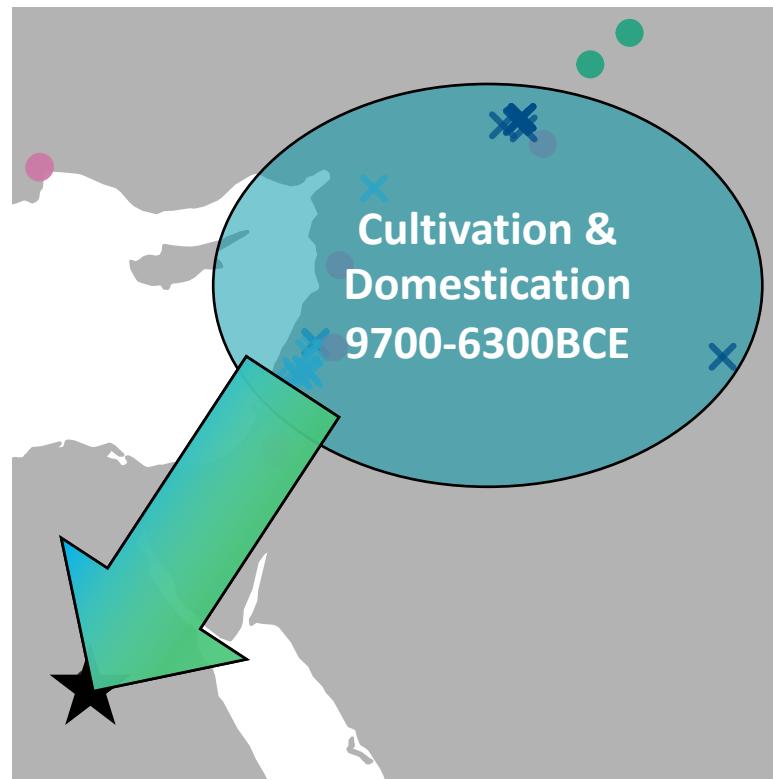

Consistent with archaeobotanical data showing non-shattering fixed in emmer by 6300BCE

Dispersal

- Dispersal to Egypt connected with early eastwards dispersal
- Evidence of gene flow with wild emmer wheats

Domestication

- Shares history of selection with modern domesticated emmer wheats
